

Crown Lengthening with Bone Removal

Purpose: A surgical procedure to expose more of a tooth's structure by reshaping the gum tissue and removing some underlying bone, often for restorative or cosmetic purposes.

First 24–48 Hours:

- Mild bleeding, swelling, and discomfort are normal.
- Apply ice packs for 15–20 minutes at a time during the first day.
- Keep head elevated when resting.

Pain & Sensitivity:

- Take prescribed pain medications and antibiotics exactly as directed.
- Mild tooth sensitivity may persist for several weeks.

Oral Hygiene:

- Avoid brushing directly over the surgical site for the first week.
- Use prescribed antimicrobial rinses to keep the area clean.

Diet:

- Eat soft foods for the first 3–5 days.
- Avoid hard, crunchy, or spicy foods.

Special Precautions:

- Avoid strenuous physical activity for 48 hours.
- Do not smoke or consume alcohol during healing.

Follow-Up:

- Attend all scheduled follow-up appointments for suture removal and healing checks.
- Contact your dentist if bleeding continues, swelling worsens after 3 days, or signs of infection occur.
