

Dental Sealants

Purpose: Thin protective coatings applied to the chewing surfaces of back teeth to help prevent decay.

First 24 Hours:

- Avoid chewing until numbness wears off if anesthesia was used.
- Sealants harden immediately, so normal eating can resume right away unless told otherwise.

Pain & Sensitivity:

- Sealants are usually painless; mild gum tenderness may occur if soft tissue was touched.

Oral Hygiene:

- Brush and floss normally.
- Sealants protect the tooth surface but do not replace good oral hygiene.

Diet:

- Avoid chewing very hard foods (ice, hard candy) that could chip the sealant.
- Sticky foods may loosen sealants over time.

Special Precautions:

- If you feel roughness or a sealant seems loose, contact the office for evaluation.

Follow-Up:

- Sealants can last several years but should be checked regularly at dental visits.
- Touch-ups may be needed to maintain full protection.
