

## TAD (Temporary Anchorage Device) Placement in Orthodontics

**Purpose:** Placement of a small screw-like device in the jawbone to provide stable anchorage for orthodontic tooth movement.

**First 24 Hours:**

- Mild soreness and swelling are normal.
- Avoid touching the TAD with your fingers or tongue.
- Do not use the area for chewing.

**Pain & Sensitivity:**

- Use OTC pain relievers if needed.
- Mild discomfort is common for the first 1–2 days.

**Oral Hygiene:**

- Brush normally but avoid the immediate area around the TAD for the first 24 hours.
- Use an antimicrobial mouth rinse as directed to keep the site clean.

**Diet:**

- Eat soft foods for the first day.
- Avoid sticky, hard, or crunchy foods that may dislodge the TAD.

**Special Precautions:**

- Avoid playing with or pushing on the TAD with your tongue.
- Do not attempt to tighten or adjust the device yourself.
- Avoid contact sports unless using a mouthguard.

**Follow-Up:**

- The orthodontist will check stability and cleanliness at regular visits.
- Contact the office if the TAD feels loose, causes significant pain, or there are signs of infection.
