

Pulpotomy

Purpose: Removal of the infected or inflamed pulp tissue from the crown portion of a tooth, often in children, to preserve the remaining healthy pulp.

First 24 Hours:

- Avoid chewing on the treated tooth until numbness wears off.
- Some tenderness or mild discomfort is normal.

Pain & Sensitivity:

- Use OTC or prescribed pain relievers as directed.
- Tooth sensitivity to temperature or pressure may last for several days.

Oral Hygiene:

- Brush and floss normally, avoiding excessive pressure on the treated tooth.

Diet:

- Soft foods are recommended for the first day.
- Avoid sticky or hard foods that could dislodge temporary fillings.

Special Precautions:

- If a stainless steel crown or temporary restoration is placed, avoid chewing gum or sticky candies.

Follow-Up:

- A permanent restoration may be required later.
- Contact the office if pain worsens, swelling occurs, or the restoration becomes loose.
